

Self Catheterization Female

About MTG Urinary Catheters

Medical Technologies of Georgia is wholly devoted to improving the quality of life for anyone using intermittent catheterization. At MTG, it's our goal to make self-catheterization of the bladder possible for anyone regardless of gender, disease, or disability.

MTG is a manufacturer of unique male, female, and pediatric catheters. Many users with hand and finger dexterity impairment find our technology to be life-changing, bringing independence to their bladder care program. Our patented MTG EZ-Advancer® valve holds the tube in place during insertion, preventing slippage back into the bag. For those with minimal finger dexterity, we offer our patented MTG EZ-Gripper®, created for utilization by tetraplegic (aka quadriplegic) users. If your doctor has prescribed intermittent catheters, MTG likely has as an answer for you.

Upon opening the package, everything necessary for the catheterization procedure is within. No more searching for lube, gloves, urinal, etc. In our complete catheter kits, we offer cuffed, folded latex-free gloves, non-staining BZK antiseptic, gauze and underpad. For those who do not

require kit components, we offer catheter-alone versions of all products. Straight or coude tip, French sizes 8-16, firm or soft vinyl, and various lengths are all available.

MTG Catheters are 100% latex-free, pre-lubricated, closed catheterization systems. Our soft, silicone introducer tip permits the catheter tube to bypass bacteria within the distal urethra, a primary source of contamination and UTI causing pathogens. There's comfort in knowing that proper use minimizes contamination of the bladder and reduces the risk of recurrent UTIs. In summary, our closed system is intended to Protect and Collect; protect the sterility of the catheter during the entire procedure and collect the urine upon voiding.

Just because you cath, doesn't mean you have to stay home. MTG offers the perfect products for your busy lifestyle. Most MTG catheters are available in our Mini-Pak traveler variety. The travel package is smaller, fits in your pocket or purse, includes all kit components described above, and

also contains our very popular privacy bag for discreet disposal of used catheter and supplies afterwards.

Medical Technologies of Georgia

Medical Technologies of Georgia, Inc. (MTG) began operations in 1997 primarily as a supplier of urological catheters in Europe. MTG is a family-owned business and most of the principals formerly owned and operated MMG Healthcare. MMG was the pioneer in developing the first successfully marketed, closed system catheter proven to reduce the risk of recurrence of Urinary Tract Infections for people who use intermittent catheterization.

In 2008, MTG reintroduced a line of greatly improved, closed system catheters. The most widely heard complaint in the MMG days concerned dexterity. If the user didn't have great hand functionality, they weren't good candidates for closed system catheters. At MTG, we overcame these objections and developed product improvements to address this issue. Along with our new products for paraplegics, we introduced unique

catheters for tetraplegics, women, and children in packaging options designed to complement modern lifestyles.

Innovation is our buzzword at MTG. We continue to develop new technologies and concepts for urinary retention solutions. As founder of both MMG and MTG, over the years I have attempted to listen to all of your concerns and comments. I've tried to incorporate your ideas into our products and I continue to do so. You're always welcome to contact me directly with any thoughts or suggestions and I will do my best to respond to them. Thank you for your support both past and present.

EZ-Advancer® Urinary Catheters

For those with some finger and hand dexterity, MTG EZ-Advancer® includes our patented locking valve, preventing the catheter from retracting into the bag during insertion. Our Mini-Pak version fits in the pocket, or purse and the privacy bag is provided for discreet disposal.

MTG closed system intermittent catheters, inclusive of our soft introducer tip, are designed to reduce risk of recurrent Urinary Tract Infections. For many potential users, catheter

insertion is very difficult using ordinary closed systems, since the tube will slip back into the bag. Fine motor use of the fingers, the ability to pinch, and then to hold the tube stable, are required to

use other brands. With the patented MTG EZ-Advancer® valve, holding the tube in place, there is no retraction. If you've experienced difficulty advancing any other catheter, we ask you to try MTG.

Instant Cath® Urinary Catheters

For those who prefer the classic, closed intermittent catheter system design, MTG offers our high quality, 16" length catheter with polished eyes. Our soft introducer tip helps reduce contamination. The catheter is supplied in a complete kit that fits easily in the pocket or purse and the Mini-Pak version includes our popular privacy bag for discreet disposal.

Closed system urinary intermittent catheters, inclusive of introducer tips, are designed to reduce the risk of recurrent Urinary Tract Infections (UTIs). Medical Technologies of Georgia, Inc. is proud to introduce you to MTG Instant Cath®, a closed system packaged in Mini-Pak, our traveling option that fits in your pocket or purse. For those who prefer a larger outer package, we offer Standard-Pak.

In the 1990's our original company, MMG developed the most popular closed system catheter of that era. We believe we have improved on the popular classic design by offering our Mini-Pak version. MTG Instant Cath® is available in both straight and coude tip. For travel, school, or work, reduce the concern for contamination. Please visit our Samples Request page to try MTG Instant Cath®.

MTG Instant Cath® Features

- Mini-Pak version includes our popular privacy bag for discreet disposal of used catheter and supplies.
- The catheter is pre-lubricated, so setup time is minimal.
- The MTG introducer tip is designed to reduce the risk of recurrent Urinary Tract Infections.
- Soft, fire polished, smooth eyelets (drainage holes) allow for comfortable passage through the urethra and into the bladder.
- Offset eyes, located near the tip of the catheter, provide drainage from two points within the bladder.
- The catheter bag protects the sterility of the tube and collects the urine. The bag capacity is 1500 ml.
